Haddenham Parish Climate Emergency

Year 1

Report 27/01/21

Haddenham Horticultural Society Meeting

Nota Bene

This is, and will always be, a work-in-progress. If you spot any errors, have better data and/or ideas and suggestions please alert both d.ohanlon@haddenham-bucks-pc.gov.uk & clerk@haddenham-bucks-pc.gov.uk

Updates and corrected versions will be issued

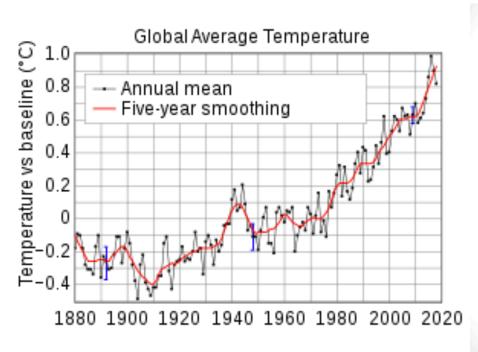

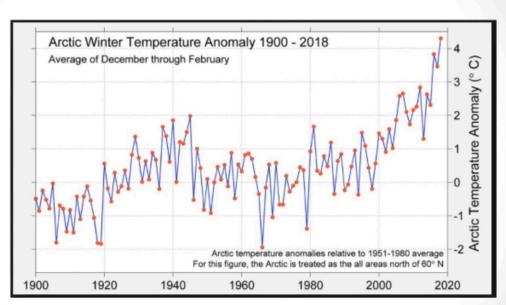

What's the rush?

Is this really an "emergency"?

The Arctic is Warming Faster Than The Global Average And The Ice Is Melting

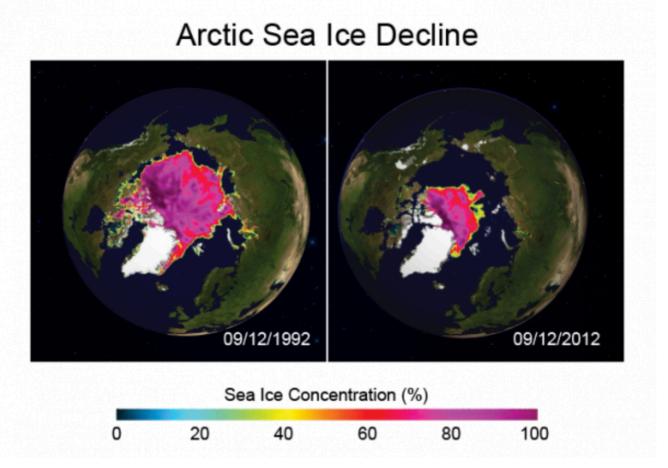

These two graphs look the same – showing temperature rising in the last few decades. But the scales are different:

the global temperature on the left is from -0.5°C to + 1°C the Arctice temperature on the right is from -2.5°C to +4.25°C You'll notice the Arctic rise is all in the past 18 years

Sea Ice Decline Reduces Heat Reflection & Accelerates the Warming

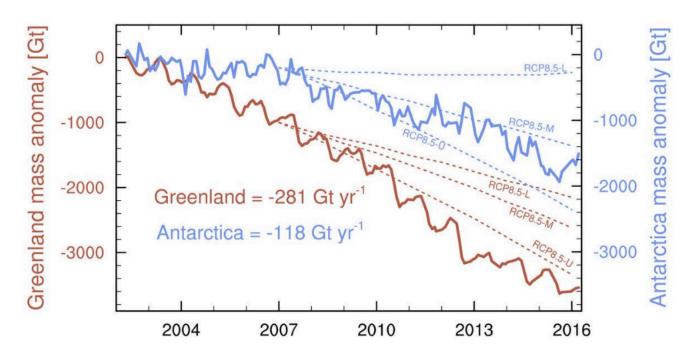

Ice reflects the suns heat, while sea water absorbs it. This causes a vicious cycle

Sea Ice Decline Doesn't Raise Sea Levels But Greenland's Ice Melting Does

If all of Greenland's ice melts it will raise global sea levels by 7 metres (23 ft)

Graph shows ice loss of both Greenland & the Antarctic

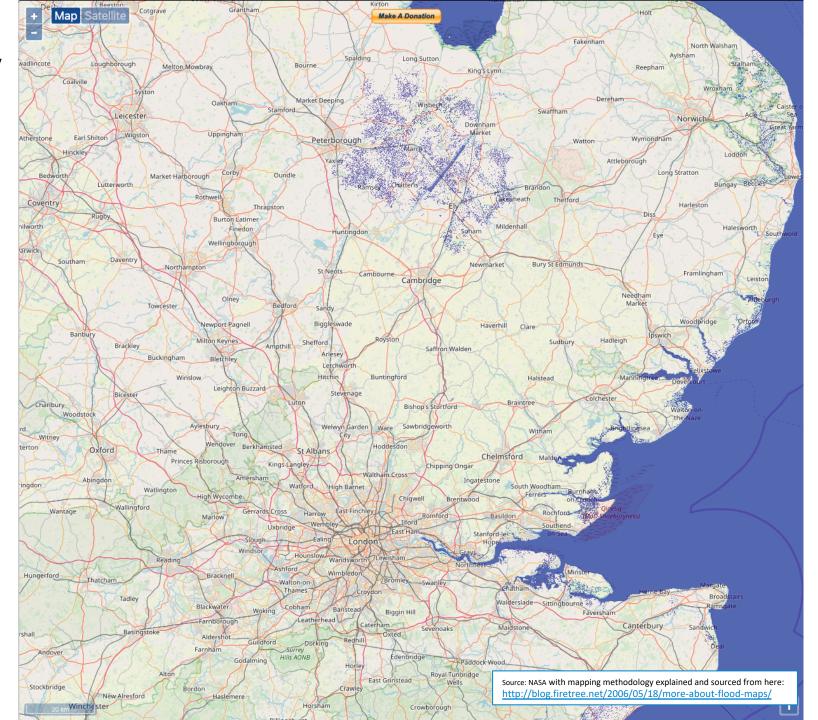

Lines such as RCP8.5 show the modelled predictions from 2007 of the Lower [L], Medium [M] and Upper [U] amounts of ice expected to be lost

The actual loss has exceeded the worst-case prediction

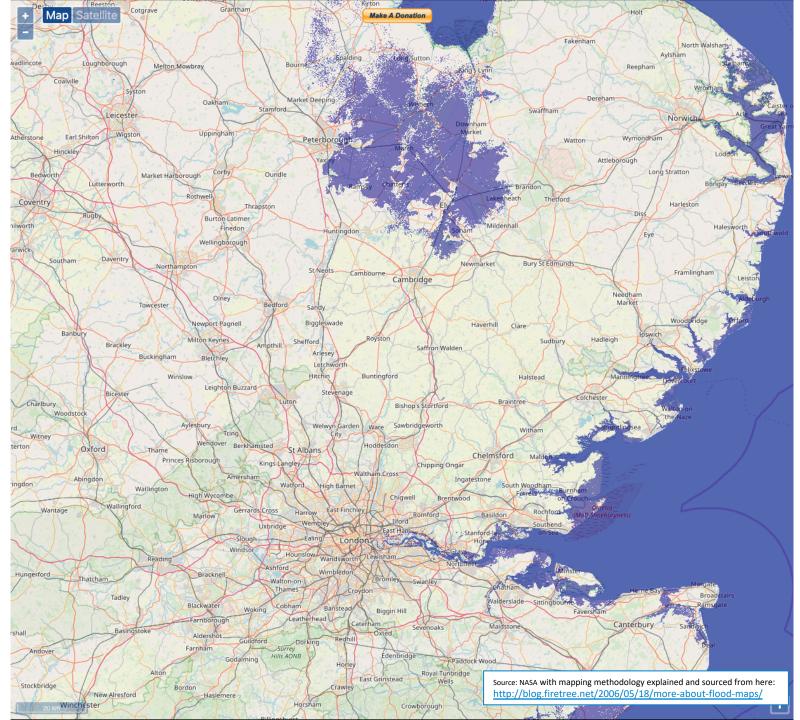

Units are Giga [billions of] tonnes [Gt] of ice per annum [yr⁻¹]

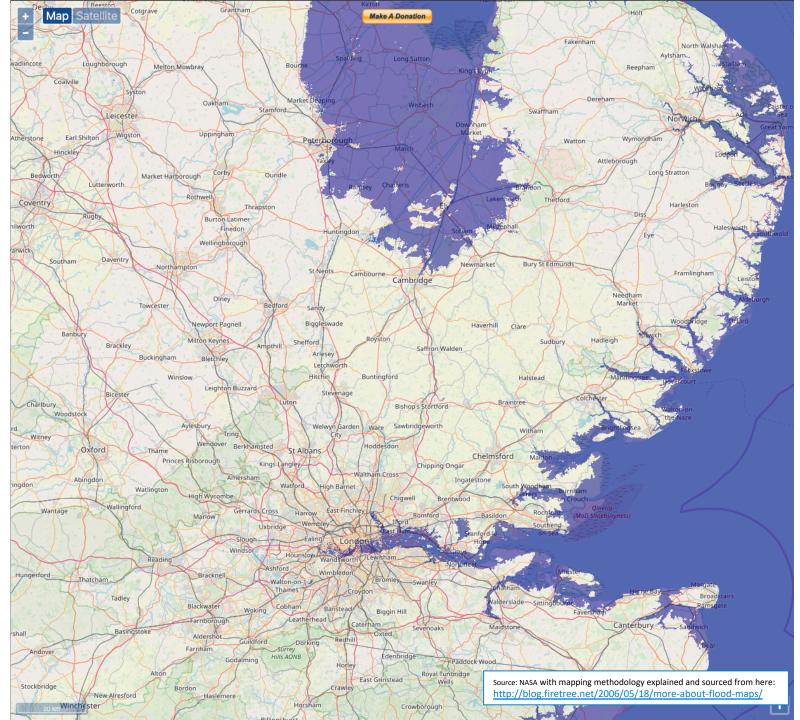

The UK today

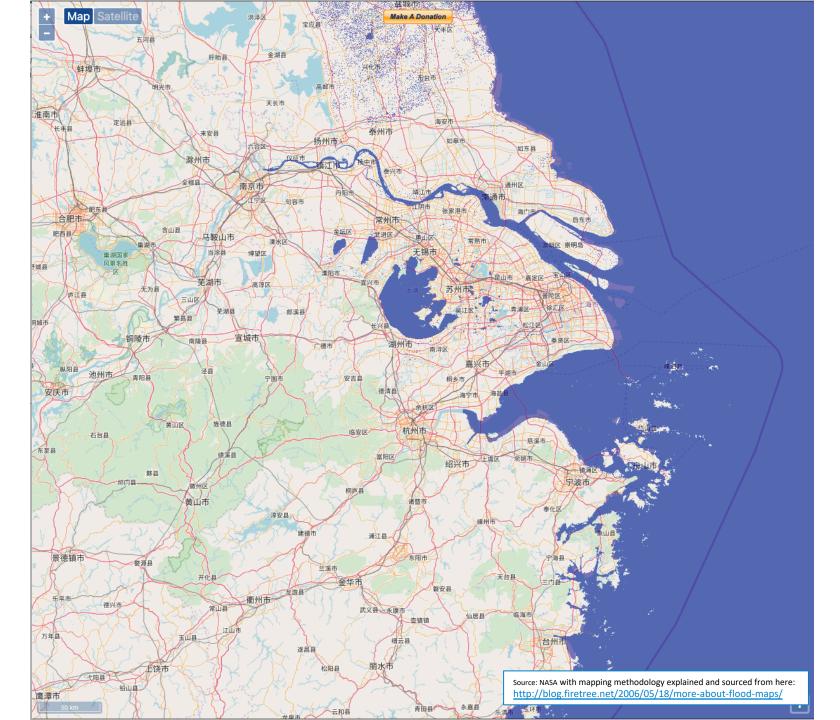

The UK with a 2 metre rise in sea level

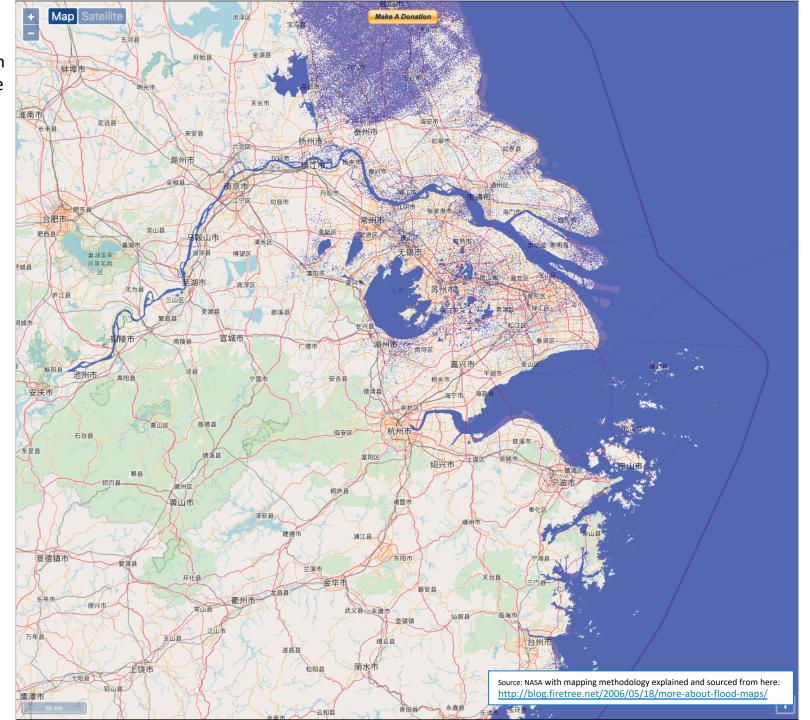

The UK with a 7 metre rise in sea level

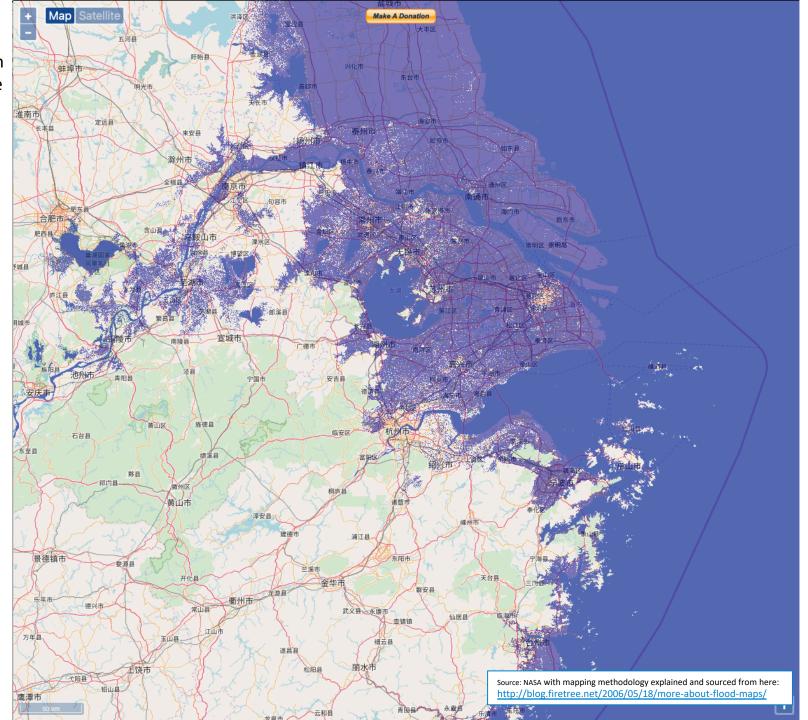

Shanghai today

Shanghai with a 2 metre rise in sea level

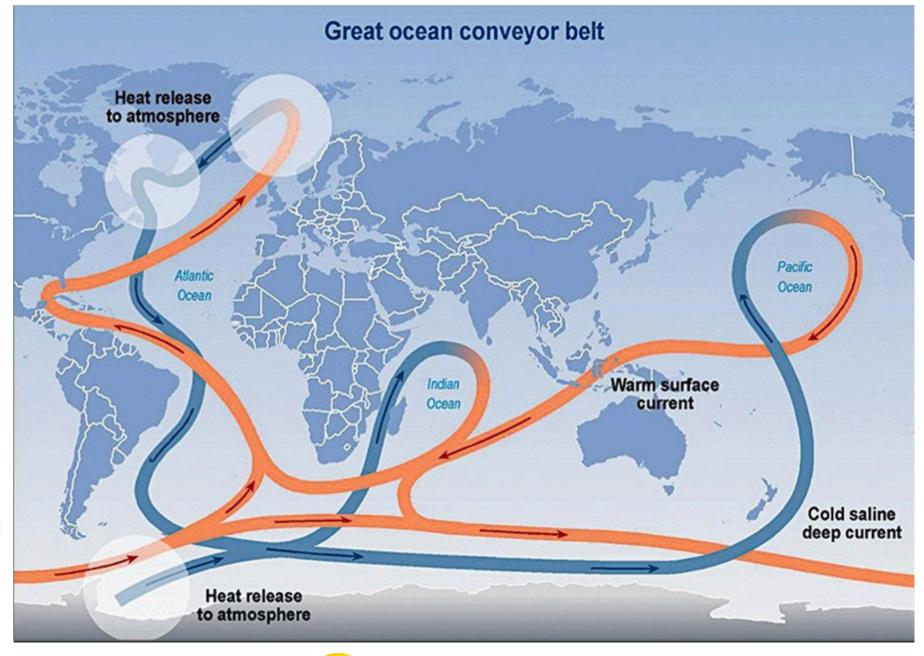

Shanghai with a 7 metre rise in sea level

Also, Greenland's glaciers melting is likely to "switch off" the Gulf Stream

This would leave the UK without its warming effect

The UK is at the same latitude as parts of Canada and Siberia that are quite cold

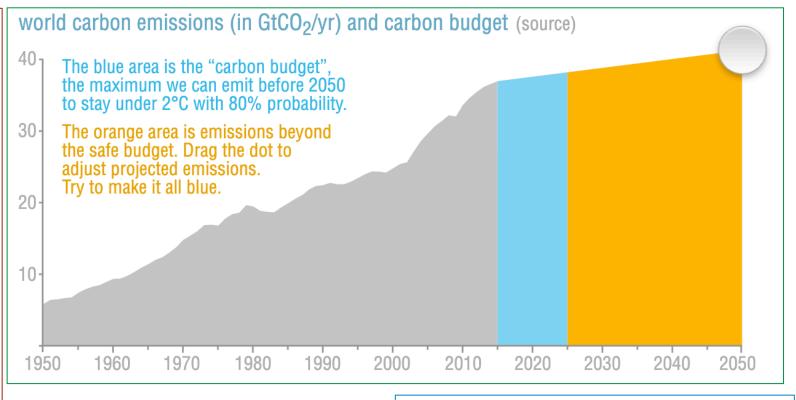

Source: UN Intergovernmental Panel on Climate Change [IPCC] via Smithsonian Magazine https://www.smithsonianmag.com/smart-news/ocean-current-keeps-europe-warm-weakening180968784/

Why it's an emergency

We have models of what is needed to stop this happening.

This interactive (on its source webpage) shows how long we have

Business as usual would mean we get to a 2 degree rise by the mid 2020's

Carbon Tracker Initiative Unburnable Carbon (citi

http://www.nature.com/nature/journal/v458/n7242/full/nature08017.html)

"The Potsdam Climate Institute has calculated a global carbon budget for the world to stay below 2C of warming. This uses probabilistic climate change modelling to calculate the total volume of carbon dioxide (CO2) emissions permitted in the first half of the 21st century to achieve the target. This revealed that to reduce the chance of exceeding 2 C warming to 20%, the global carbon budget for 2000-2050 is 886

carbon budget 2015-2050: From the 886 GtCO2 budget for 2000-2050, I subtracted out the 440 GtCO2 already spent 2000-2014, leaving 446 GtCO2 remaining for 2015-2050.

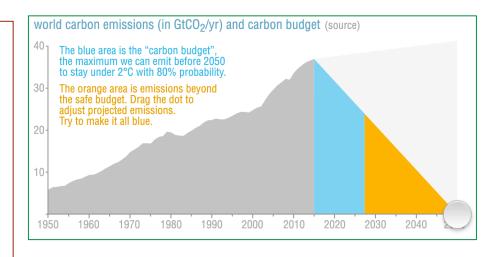

Why it's an emergency

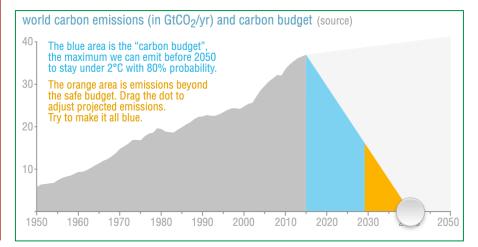

The UK target of 2050 sounds ambitious.

Many say it's too ambitious.

But that rate of change will only delay crossing the 2 degree threshold by about 3 years

2040 is also not adequate as a target

Sources: All via http://worrydream.com/ClimateChange/

Why it's an emergency

2035 is the latest we can get to zero carbon and not pass a point of no return to a climate that melts the ice and more generally will be hostile to human life

We are adopting 2030 because so far climate change has happened at a faster rate than the scientists' models have suggested

Zero carbon is actually not even enough

Getting to zero carbon only actually stops things getting worse.

Extreme weather, semi-melted ice caps already are in place.

We will need to become carbon negative to get the CO₂ in the atmosphere back down to the levels that existed before we blundered into making them so high

The cumulative contributions to the global carbon budget from 1850 The carbon imbalance represents the gap in our current understanding of sources & sinks

Achieving Zero-Carbon for Haddenham Parish by 2030

Strategy

Objective:

Haddenham Parish to be carbon neutral by 2030

Diagnosis:

The main obstacles are:

- Lack of knowledge regarding what action(s) will make most difference (& when to take them)
- · The inertia of existing habits

Guiding Policy:

- Use an evidence-based approach to identify the fewest & highestimpact actions for residents to take to deliver the objective
- Package these as initiatives using a "pilot" structure and enroll early adopters via multiple existing social networks in the parish

Strategy

Specific Actions:

- 1. Identify main sources of emissions
- 2. Recognise which will be affected by other players / technological change / govt action, & when
- 3. Identify where behavioural change of residents, HPC and organisations within HPC's sphere of influence can have the most impact per £ spent and volunteer hour given
- 4. Create a decadal calendar of initiatives with a maximum of four at any one time (the four not including research or HPC lobbying government of other bodies)
- 5. For each pilot Contact all existing social networks in Haddenham (real life & virtual). Engage with each & enroll only the genuine enthusiasts for that pilot
- 6. For each pilot enable, measure, receive feedback, reflect & improve

Addressing Main Obstacle #1

Lack of knowledge regarding what action(s) will make most difference (& when to take them)

The basic maths

Carbon emissions are measured in tonnes (t), kilotonnes (kt) or megatonnes (Mt) of carbon dioxide (CO₂) per annum (y⁻¹)

With other greenhouse gases such as methane, emissions are measured as CO₂ equivalents, written CO₂e

On average emissions per capita in Haddenham are 8.2 tCO₂y⁻¹

Woodland & forests take in [sequester] CO₂ and release oxygen

One hectare (2.47 acres) takes in approx. 5.3 tCO₂y⁻¹

The task is to reduce the parish's CO₂ emissions as far as possible by 2030 and to plant enough trees to offset the residual emissions

By 2030 we will have approx. 3,300 dwellings (up from 2,200) in Haddenham which at UK average household size (2.40 ppl/hhld) means we will have a population just over 7,900

The table on the right shows the parish's total emission in 2030 depending on how much we can reduce per capita emissions from current levels and the hectares of woodland needed to offset them

The land area of the parish is around 1,300 hectares

Emissions in Haddenham in 2030 depending on reductions in CO2 emissions achieved

% of 2020	Emissions	Hectares of woodland
emissions per cap	(tCO2ey-1)	required
100%	64,900	12,180
95%	61,700	11,580
90%	58,400	10,960
85%	55,200	10,360
80%	52,000	9,760
75%	48,700	9,140
70%	45,500	8,540
60%	39,000	7,320
55%	35,700	6,700
50%	32,500	6,100
45%	29,200	5,480
40%	26,000	4,880
35%	22,700	4,260
30%	19,500	3,660
25%	16,200	3,040
20%	13,000	2,440
15%	9,700	1,820
10%	6,500	1,220

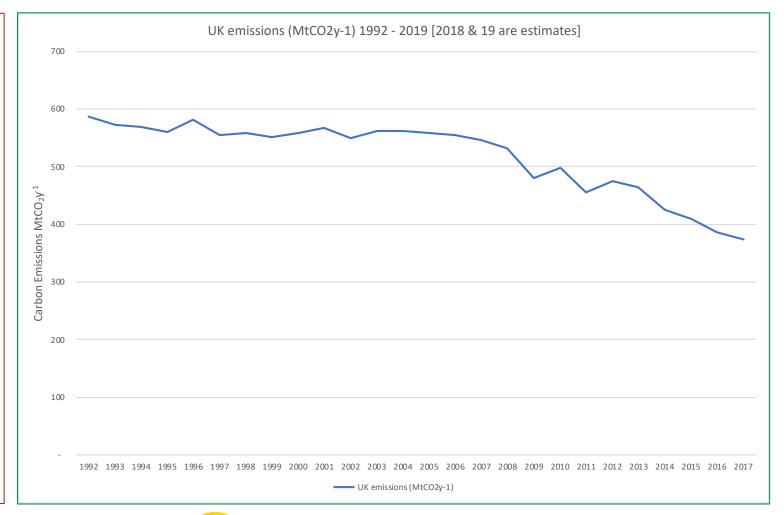

UK CO₂ emissions

You've probably heard that the UK has been dramatically reducing its carbon emissions

This is true

But there's a "but"

There are three types of emissions

Greenhouse gas emissions are categorised into three groups or 'scopes' by the most widely-used international accounting tool, the Greenhouse Gas (GHG) Protocol. Scope 1 covers direct emissions from owned or controlled sources. Scope 2 covers indirect emissions from the generation of purchased electricity, steam, heating and cooling consumed by the reporting company. Scope 3 includes all other indirect emissions that occur in a company's value chain.

Scope 1	Scope 2	Scope 3
Fuel combustion Company vehicles Fugitive emissions	Purchased electricity, heat and steam	Purchased goods and services Business travel Employee commuting Waste disposal Use of sold products Transportation and distribution (upand downstream) Investments Leased assets and franchises

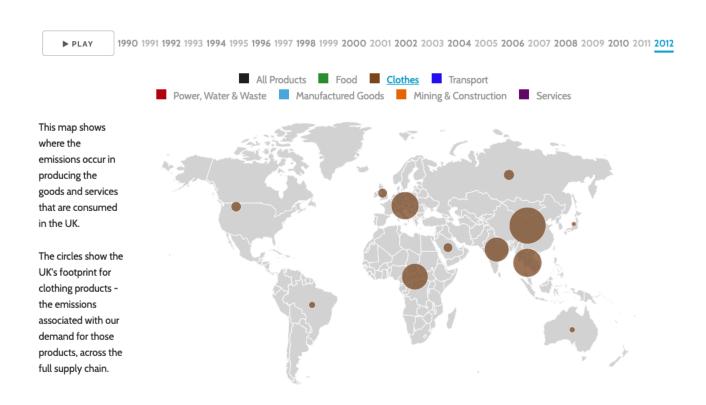

And much of the Scope 3 emissions - food, goods & services - we consume comes from outside the UK

Please note: These definitions, courtesy of the Carbon Trust, talk in terms of corporations but the definitions apply equally to individuals or organisations of any kind. "Fugitive emissions" in plain English means gas leaks.

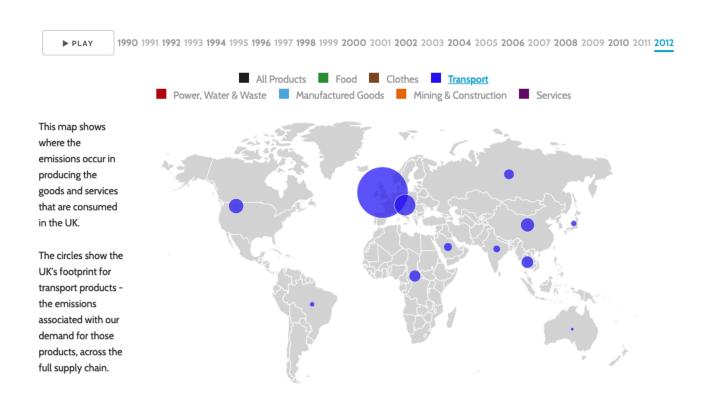

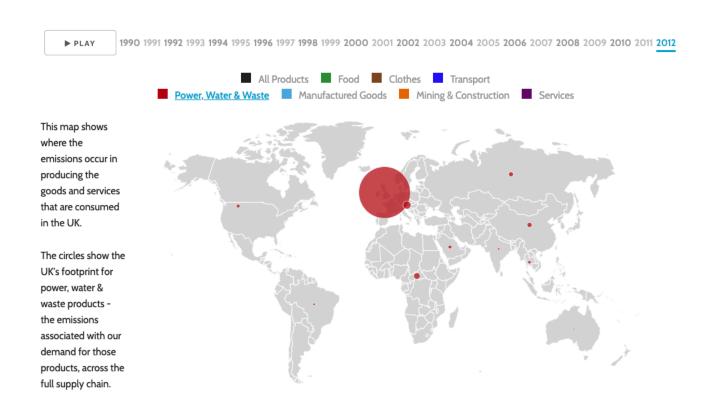

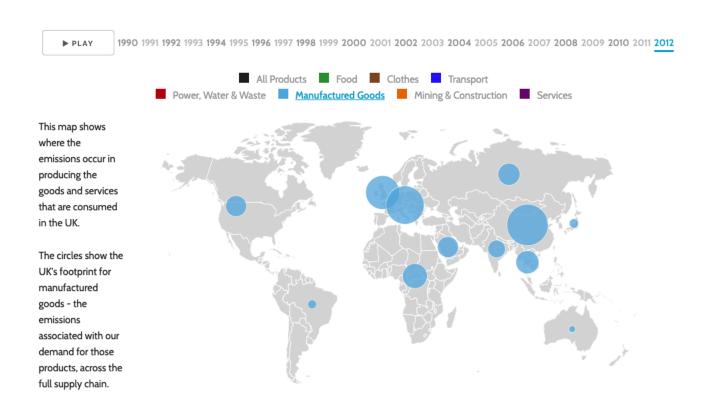

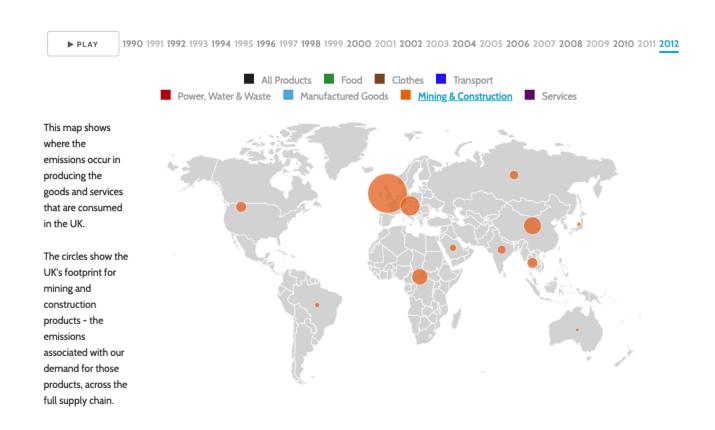

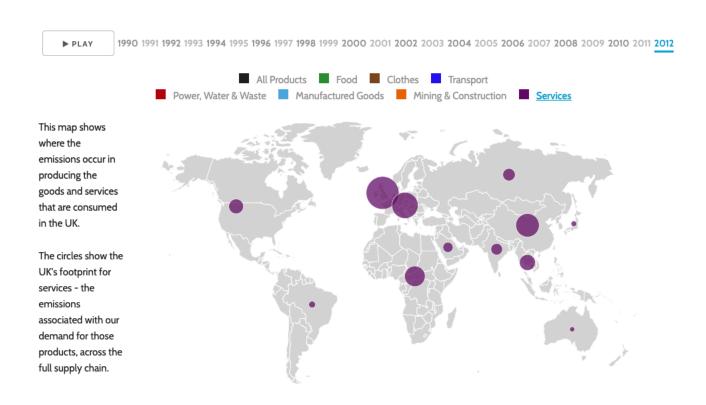

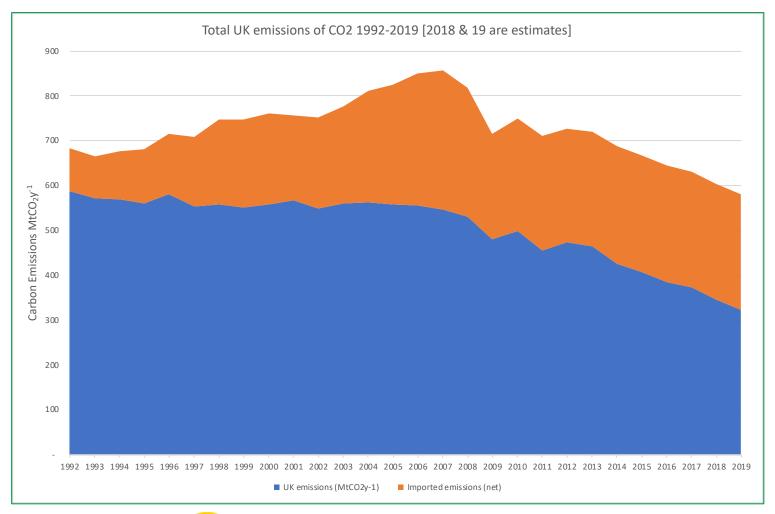

Total UK CO₂ emissions

So the emissions created by what we consume have to be included

(and what we produce, but people in other countries consume, of course are excluded)

It turns out that the UK is the second biggest importer of CO₂ emissions in the world

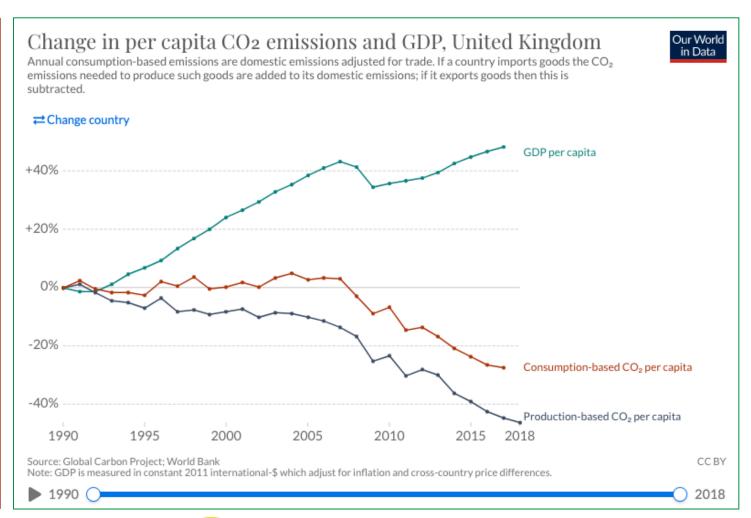

So UK emissions didn't peak in the 1980's but in 2007

Total UK CO₂ emissions

But CO2 emissions have been significantly decoupled from growth in GDP

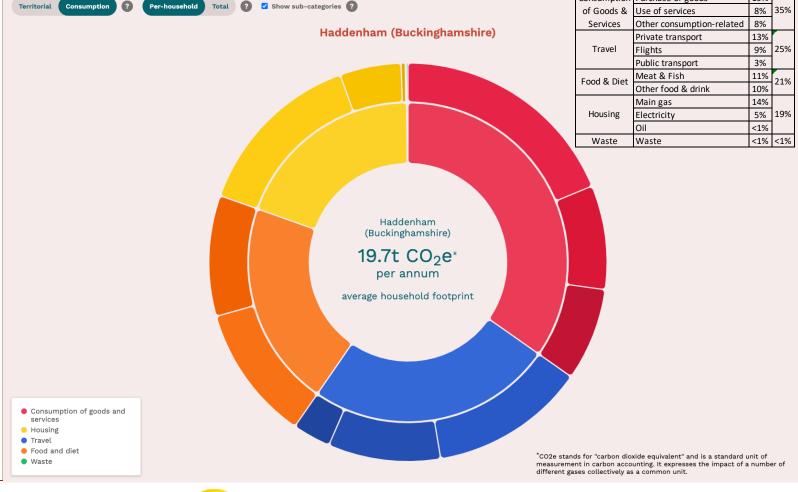

How total Haddenham CO₂ emissions break down

For the first year of this report we had to rely on applying the average consumption emissions of the UK to the parish

We have just recently received a more detailed breakdown which will improve the focus of our planning for emissions reduction

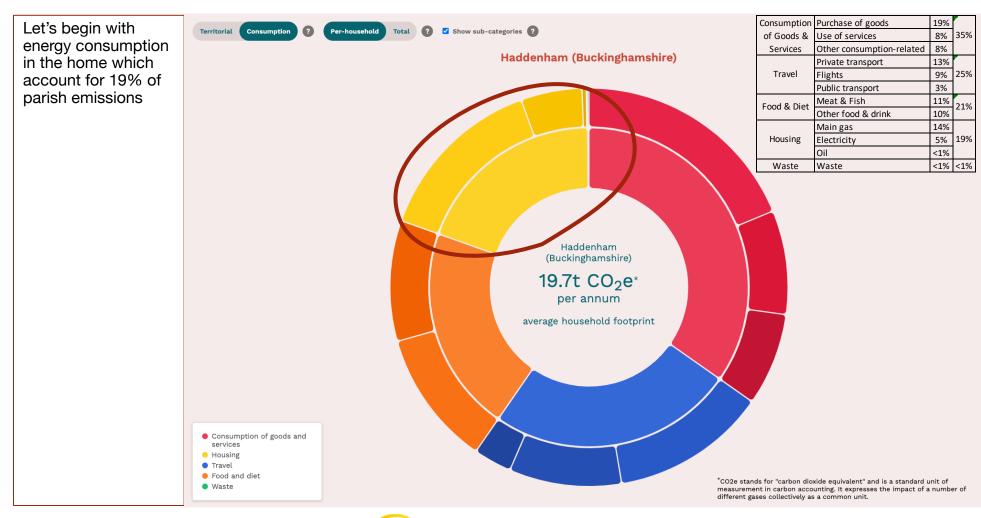

Consumption Purchase of goods

19%

How total Haddenham CO₂ emissions break down

Power, water & waste - Electricity

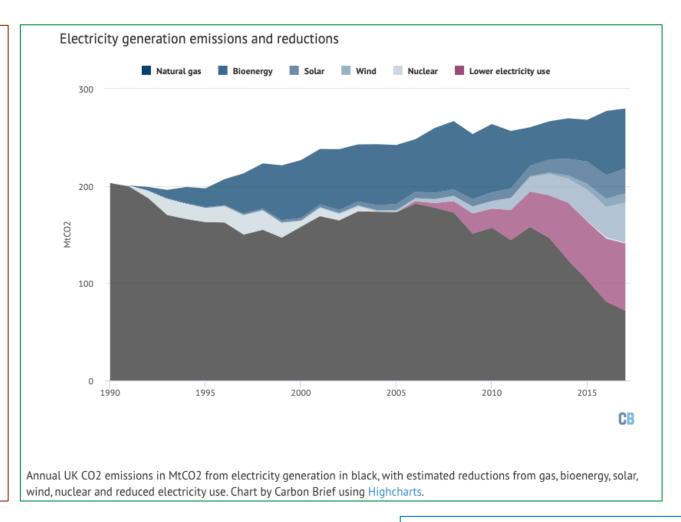

Heating & lighting homes used to be the biggest source of emissions

BUT!!!....

The electricity side of the industry has reduced its emissions by 60% [that's the dark grey area – the other colours show sources of reduced compared with "business as usual"

By 2030 90% of UK electricity will be carbon neutral

It's notable how much electricity-related emissions have reduced since 2012 – the date of the data on the previous slide. So Power, Water & Waste may no longer be the biggest source of emissions

Source: Carbon Brief "Analysis: Why the UK's CO2 emissions have fallen 38% since 1990" https://www.carbonbrief.org/analysis-why-the-uks-co2-emissions-have-fallen-38-since-1990 Carbon Brief "Analysis: Half of UK's electricity to be renewable by 2025" https://www.carbonbrief.org/analysis-half-uks-electricity-to-be-renewable-by-2025

Power, water & waste - Electricity

Given the reductions in electricity-related emission to -date and projected to 2030, it is gas where householder action will make a difference

								MtCO ₂ e
	1990	1995	2000	2005	2010	2015	2017	2018 (p)

Other greenhouse gases	198.0	185.4	149.2	125.8	102.5	89.6	87.0	84.4
Total greenhouse gases	794.4	745.6	707.5	683.7	600.9	498.0	460.2	448.5

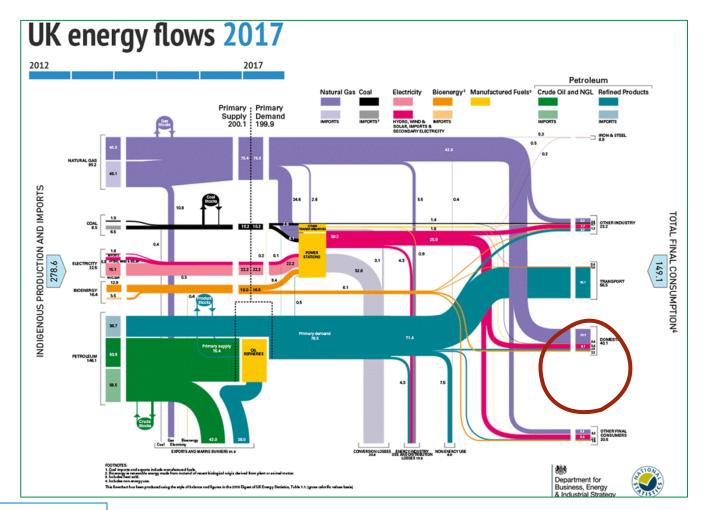

Power, water & waste - Gas

HOWEVER the technology & policy to fund & enable the switch from gas boilers to electric heat pumps at scale will not be ready until circa 2023

So this project will wait until then unless govt / technology enables mass action sooner

Action: There will be a project to enable and encourage the switch from gas boilers to electric heat pumps, probably from 2023 onwards

NB The chart shows the sources of energy in the UK, where it is ultimately consumed, and the flows in-between. It's generally for information for those interested but it shows the predominance of gas in domestic consumption

What about Green Energy Tarriffs?

We are **NOT** asking people to switch to green energy tariffs

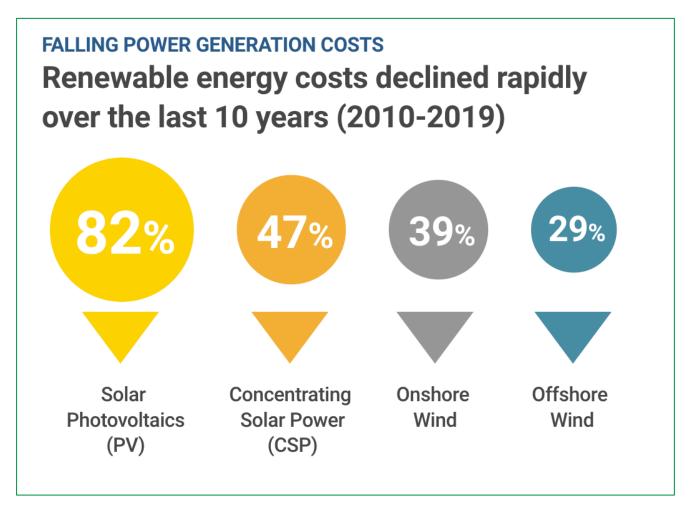

Why?

Because while they used to result in higher investment in renewable generation capacity, they now make NO DIFFERENCE to what is generated.

Why?

Because renewables are cheaper to generate than fossil fuels so pure commercial economics is driving all investment into increased renewable generation

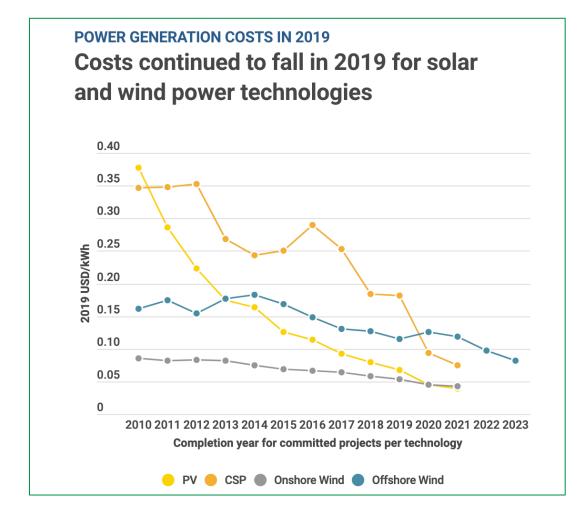

So while your energy consumption will all be renewables the UK's electricity pool will not be affected. Someone else will receive the fossil energy you previously received

What about Green Energy Tarriffs

In fact for the mathematicians among you, if this had been put on a log scale graph you'd be able to see that the rate of decline in costs is actually increasing

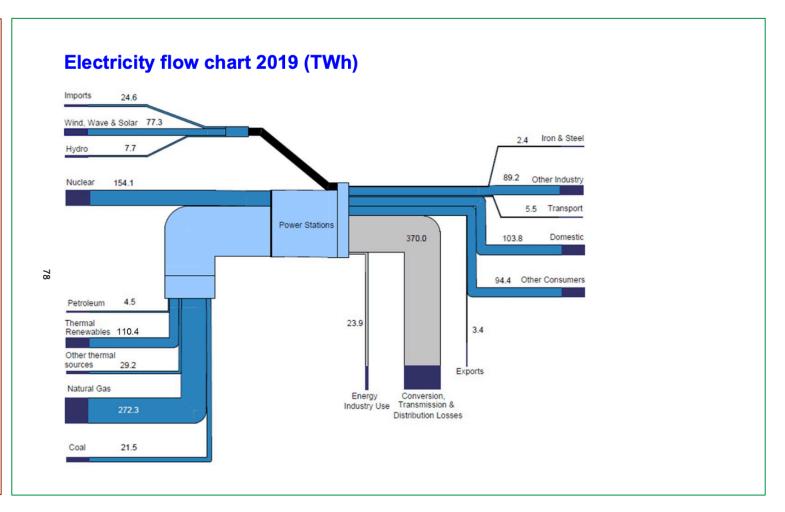

What about Green Energy Tarriffs?

If we zoom into the electricity power station part of the complicated diagram from two slides ago, it used to be the case that being on a green tariff subsidized and expanded the inputs from Wind, Wave & Solar.

But now they are cheaper sources than coal, gas & petroleum your choice of tariff makes no difference whatsoever to the national picture

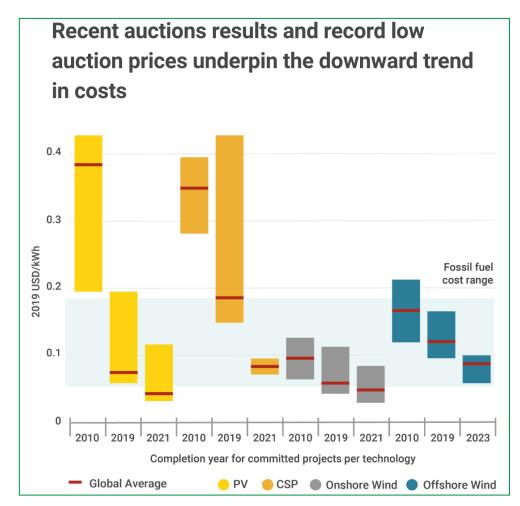

What about Green Energy Tarriffs

And it is vitally important for the Parish Council & this project to not advocate action that has no impact on emissions

Why?

- 1. If people take the time & trouble to switch to a "green tariff" they can easily feel they've now "done their bit" & therefore have done enough so they don't then do the things that will make a difference. This is a risk that is easily avoided!
- 2. We lose credibility & would rightly be accused of virtue signaling or not knowing what we are talking about.

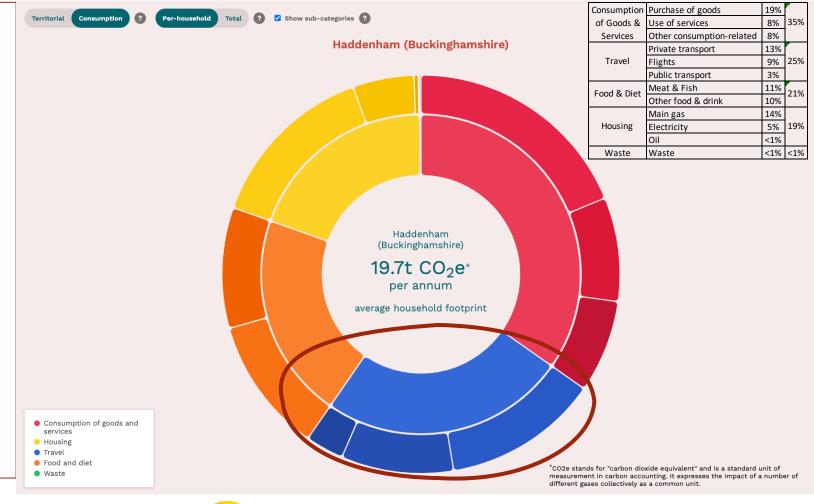

Transport

Transport is the second highest single source of emissions

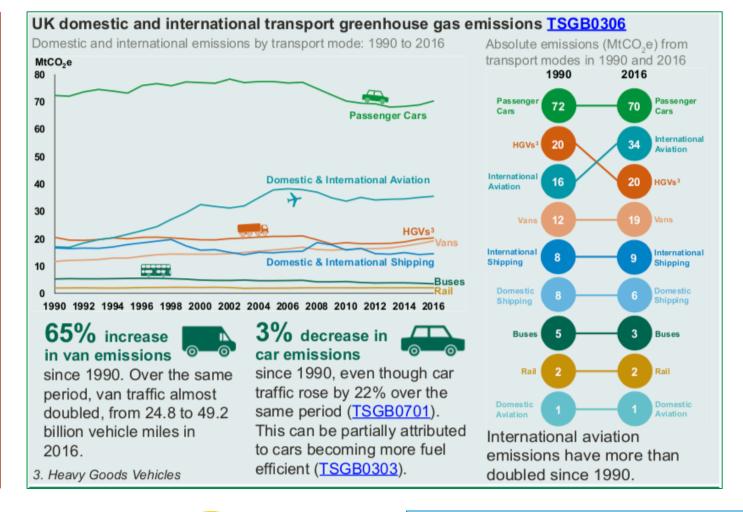

But how does it break down in detail?

Transport – by mode

Cars and aviation are the main items

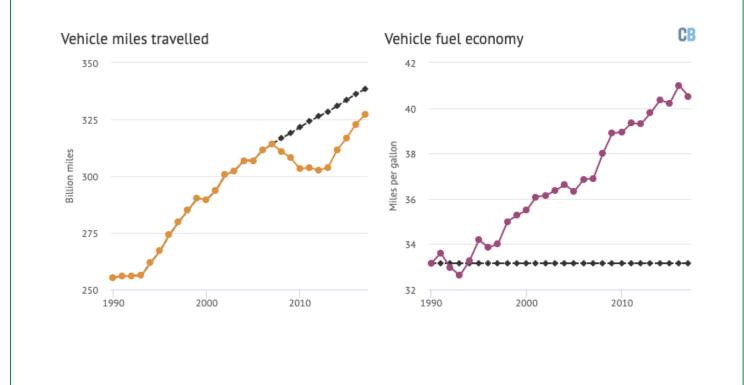

britain-leibling-171008-report.pdf

Transport – Cars

Car emissions are unchanged over 25 years as increased usage has offset improved fuel efficiency

Annual miles travelled and vehicle fuel economy (in miles per gallon). Black lines in each plot represent the business as usual scenario: 1990 fuel economy levels and fixed per-capita miles traveled after 2007. Note the truncated y-axes. Data from the UK Department for Transport; chart by Carbon Brief using Highcharts.

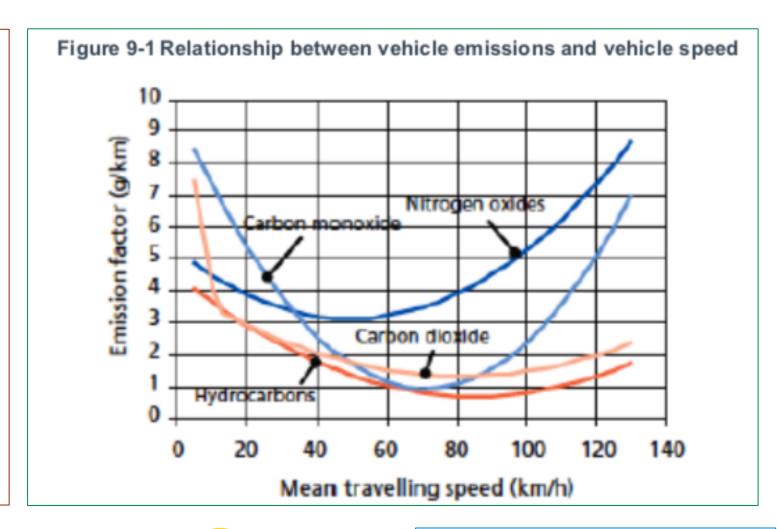

Vehicle Emissions – by speed

Some people think that in addition to the other benefits of reducing speed limits to 20mph that the push for zero carbon will augment their case

Sadly not

Cars are optimised for emissions at 56mph (90km/h)

Driving faster or slower progressively increases emissions per mile

Walking & cycling have a trivial impact on emissions in rural areas

It's vital we only engage in activities that have the potential to reduce total parish emissions by a least 1% (that is to say the total emissions of 55 people each year at current levels)

Village trips to be walking or cycling only			
	Changeable		
	assumptions		Comments
Estimate of emissions from village-only trips			
Village is 1 mile across so average intra-village trip there & back = 1 mile	1.00	1	
Also assume average distance there & back when leaving the village = 1 mile	1.00	1	
Average number of car trips per annum for residents of a rural village		554	
Average distance travelled per car per annum (UK)		7,600	
Rural car distance as a percenage of national average		177%	
Average distance travelled per car per annum (Haddenham resident)		13,468	
Pecentage of mileage within the village		4.1%	
Which as a percentage of all emissions is 4.1% x 177% x 68/(68+76+271+358+(68 x 77%))		0.60%	which is below the 1% threshold
And assuming intra-village trips are 25% of all car journeys	25%	0.15%	which is a factor of 7 times below the 1% threshold
Compliance with initiative - 25%	25%	0.04%	which is a factor of 27 times below the 1% threshold
Number of residents' annual emissions eliminated	5,500	2.06	
Support Electric Vehicle Adoption			
Target of 90% using EVs rather than cars by 2030	90%	90%	
Assume National Grid meets taget of 90% decarbinised electricity supply by 2030	90%	90%	
Percentage of emissions accounted for by cars (rural) 177% x 68/(68+76+271+358+(68 x 77%))		14.60%	
Which as a percentage of all emissions is 15.57% x 90% x 90% =		11.82%	
Number of residents' annual emissions eliminated	5,500	650	
But why not do both?			
Impact of eliminating intra-village trips if 90% EV			
As a percentage of all current emissions (0.04 x (1-0.9) + 0.04 x 0.9 x (1-0.9)) =		0.01%	
Number of residents' annual emissions eliminated	5,500	0	
Impact of 90% EV if intra-village trips eliminated			
As a percentage of all current emissions (12.62 x (1-0.25*.25*4.1%)) =		11.79%	
Number of residents' annual emissions eliminated	5,500	649

zero/net-zero-energy-workforce

Walking & cycling have a trivial impact on emissions in rural areas

I've been asked to consider how this would change if we considered Thame as being a linked settlement

The issues here are achievability prior to most/all cars being EV & the percentage of journeys to be substituted

There are many reasons to support a cycleway to Thame but reducing CO2 emissions is not among them

Village trips to be walking or cycling only			
	Changeable		
	assumptions		Comments
Estimate of emissions from village-only trips			
Village is 1 mile across so average intra-village trip there & back = 1 mile	1.00	1	
Also assume average distance there & back when leaving the village = 1 mile	1.00	1	
Thame is 3.3 miles from the Village hall so a round trip is 6.6 miles	6.60	7	
Average number of car trips per annum for residents of a rural village		554	
Average distance travelled per car per annum (UK)		7,600	
Rural car distance as a percenage of national average		177%	
Average distance travelled per car per annum (Haddenham resident)		13,468	
Pecentage of mileage within the village		4.1%

Building the Net Zero Energy Workforce Report https://www.nationalgrid.com/stories/journey-to-net-zero-energy-workforce

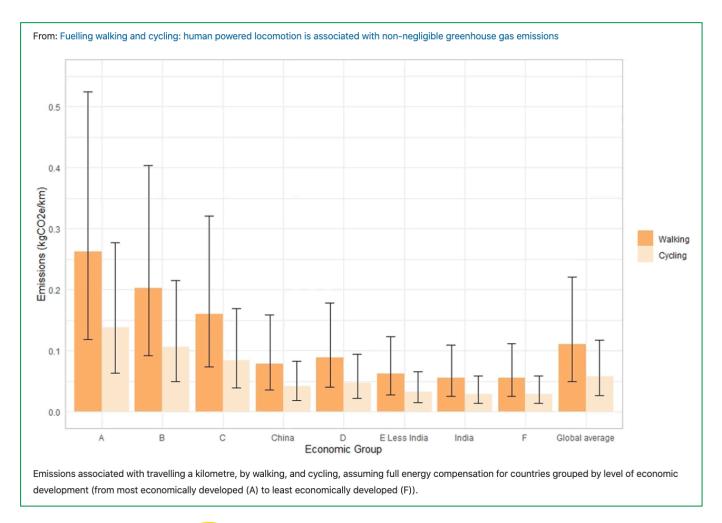

For walking & cycling to have an impact we first would need to change our diets

A June 2020 article in Nature concluded...

That people walking are not carbon neutral and may well, in economies with an energy-intensive food supply chain such as ours, be on a par with cars, while bike riding produces around a 50% reduction in emissions

That from an emissions point of view car clubs could have a bigger positive emissions impact than increasing walking, and

That from an emissions point of view more walking needs to be partnered with low carbon diets for lower emissions to be one of the benefits.

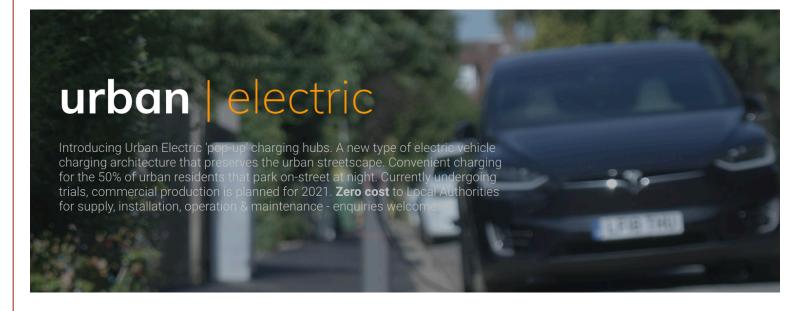

Transport – Electric cars

Given electricity will be from 90% carbon zero sources by 2030, and that the average car is scrapped after 16 years and has 4 owners, there is the potential to cut emissions from cars to single figure MtCO₂e by 2030, or about 90%

Actions:

Ensure there are no planning obstacles to off-street home charging stations

Provide on-street rapid charging for those without offstreet parking

Action:

We should also pressure Buckinghamshire Council (BC) to roll out public charging points.

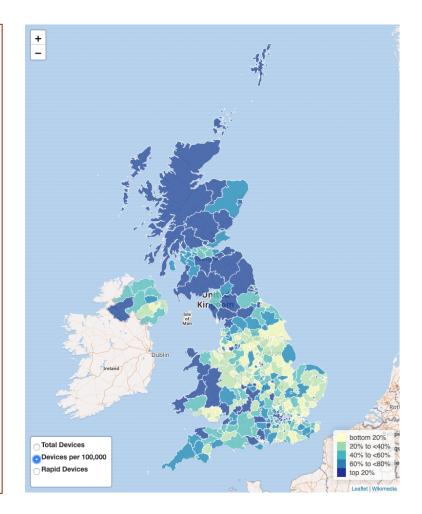

Transport – Public charging points

Action:

We should also pressure Buckinghamshire Council (BC) to roll out public charging points.

Aviation emissions vary considerably by circumstances

By income

Aviation emissions vary considerably by circumstances

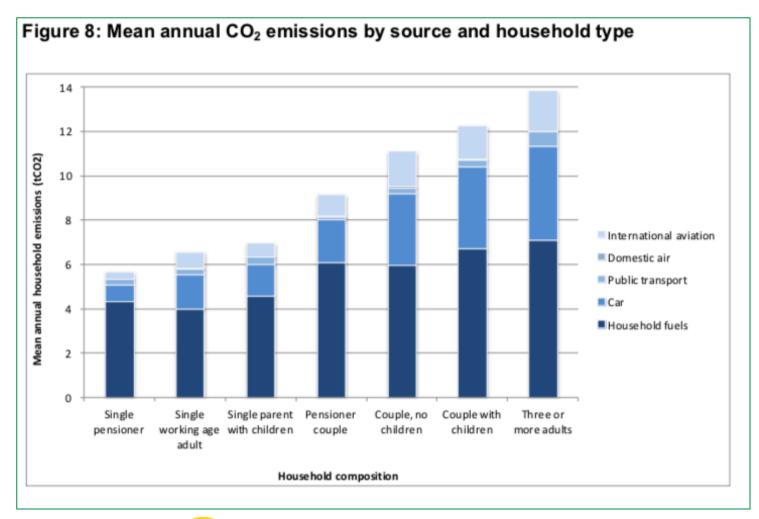

By family structure, and so on

Ideally this topic will be tackled by national / industry sector actions.

However, in the absence of these thus far...

Action: Conduct focus groups /depth interviews / informal research among residents who use international aviation in order to better diagnose the issues

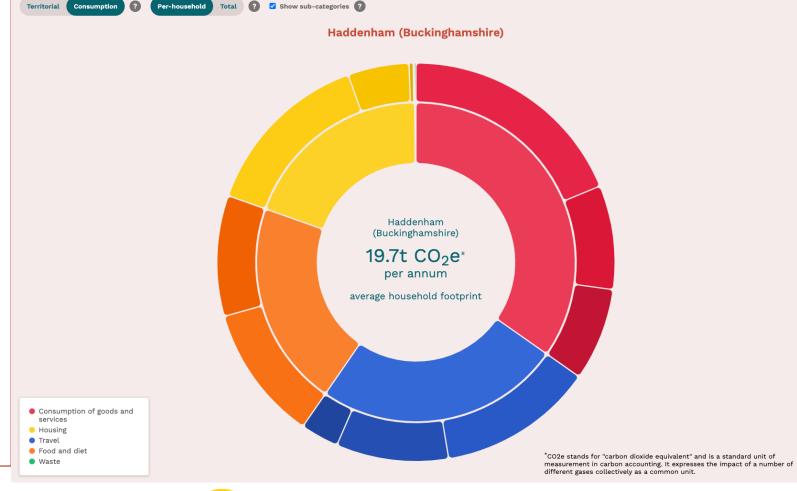

Action: Seek expertise from elsewhere and/or through desk research to elicit insights

Food

Food is the second largest homogenous source of emissions – there may be significant "hotspots" in manufactured goods and services, and more work will be done to establish if so, and what

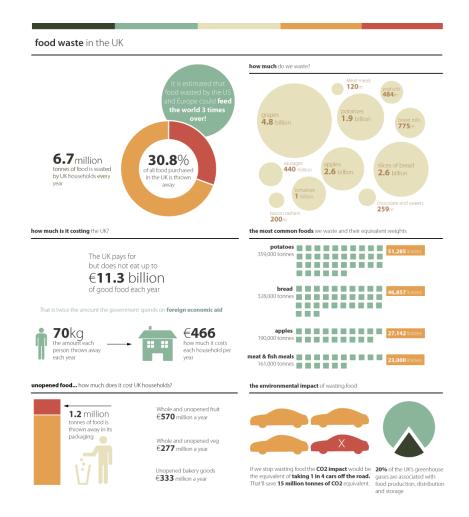

Food waste

Food is the third largest homogenous source of emissions¹

Action:

Create pilot in Q1 (calendar) 2020 to eradicate food waste in Haddenham and at the shops & farms where Haddenham residents buy their food.

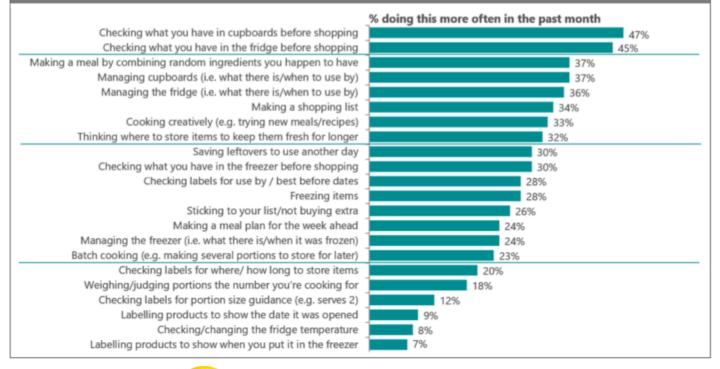

Food waste & Covid

Covid 19 has delayed the start of the food waste pilot, changed what is safe and practical for residents to do, but has also created new habits to make eliminating food waste easier

Q. In the past month would you say you are doing the following things more often, less often or the same as always? If you never do any of them, please select NA/don't do
Base: 4,197 UK adults aged 18+ with responsibility for food shopping and/or preparation in the home. April 2020

Food waste – pilot to find apps that help people

Foodsavvy.org.uk is a Norfolk- and Suffolk-based campaign working with environmental charity Hubbub to help households cut food waste inline with the United Nation's Sustainable Development Goals.

We will be using a lot of their tools and resources in the pilot Food shopping doesn't have to be a series of mental checklists and post it notes. Get techy with a little bit of help from our favouritle food waste apps. With nearly £14 billion worth of food going to waste in the UK every year, get #FoodSavry with the touch of a button.

OLIO

Get involved in your community with this popular food sharing app. Have too much food on the go? Just pop it on Oilo and someone from your local area will be happy to pick it up. Free, easy and full of community spirit.

KITCHE

Kitche it, Don't Ditch it by uploading your shopping receipts and receiving automated reminders to help you bin food waste for good. Flummoxed by the random bits and bobs in your fridge? Kitche is also packed with smart recipes to help you use up every last bite.

COZZO

Manage your pantry like a pro. <u>0x220</u> creates a digital inventory of your klitchen cupboards, makes sure you know when food will go off, and creates shopping lists to streamline your supermarket trips. Never find a mouldy potato at the back of the fridge again.

TOO GOOD TO GO AND KARMA

Sometimes we just don't have time to make that midweek meal, which is where <u>Too Good To Go</u> and <u>Kamm</u> come in. Connecting you to local businesses, these apps self food at discounted prices, so it doesn't just get thrown away. Cheap, delicious and beneficial for everyone!

GIK

Make your food choices count. Simply scan the barcode on a product and like will tell you everything from additives to the company's sustainability policy. It will give you info on animal welfare, carbon footprint and palm oil content, arming you with everything you need to make an informed choice.

EATBY APP

This EatBy barcode scanner keeps track of the food you have in your kitchen and reminds you to eat it before it goes past its use by date. The sharing function makes it easy to share your shopping list or let your family know what's for dinner.

Food labelling

Labelling food to show its carbon footprint has been discussed at least since 2010 by UK governments

Simple rules of thumb such as food miles are known to be poor guides as often it is better in emissions terms to buy food grown overseas in season than to buy polytunnel-produced food grown here or in nearby countries such as The Netherlands

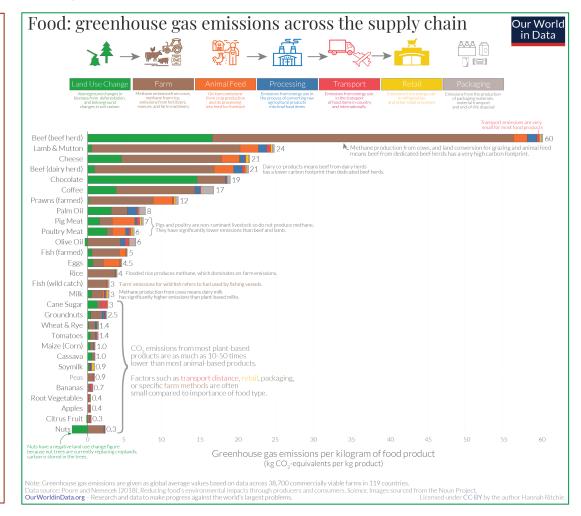

Action: Run a pilot to optimise response to carbon labelling of food when introduced circa 2023. This will be a complement to national action and timing will be dictated by when legislation comes into force

Food miles only matter for air-shipped perishables like asparagus and green beans

Food miles often crops up as something to focus on, but the less welcome news is that it is the impact on land use and especially the methane from cows that drive the emissions from food

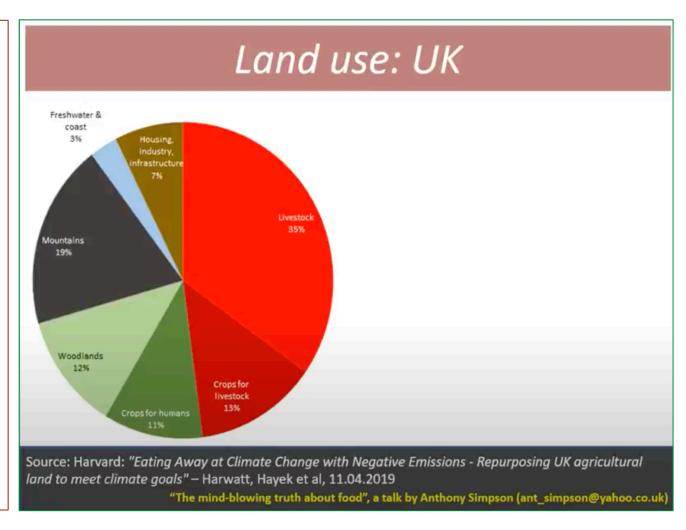

Land for livestock and the crops for food to feed them covers 48% of the UK

The UK has one of the highest levels of forest depletion in the world

For example, in Germany roughly 33% of the land is still forest

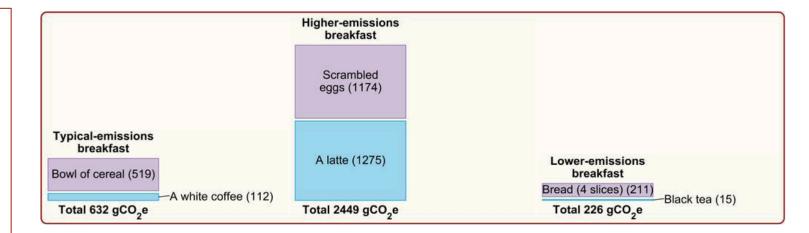

If the land used for livestock were reforested then our net emissions from the food we eat would drop to zero

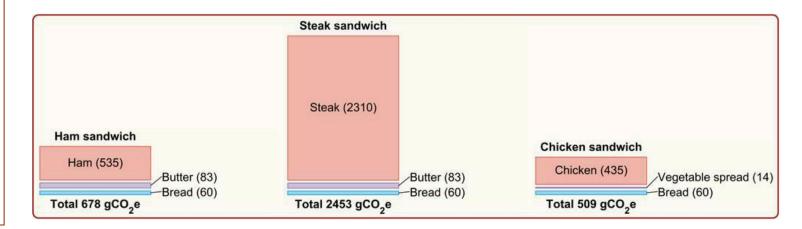

If we grew crops for humans on the land we now grow crops for animals then we would be selfsufficient in food whereas now we also need a land mass 50% of the UK overseas to feed ourselves

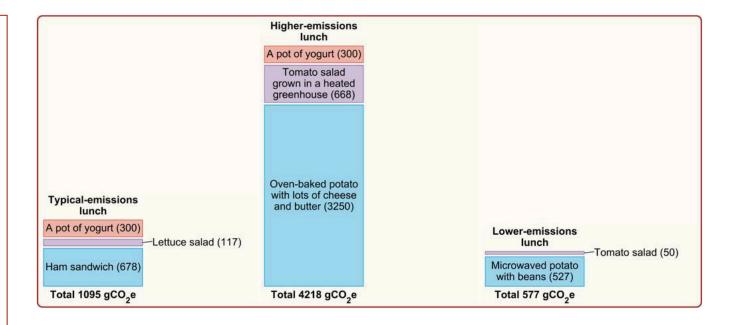

Some examples of high and low carbon meals – ahead of food labelling

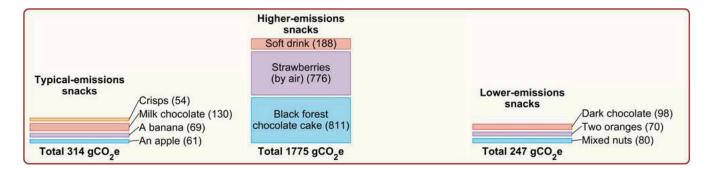

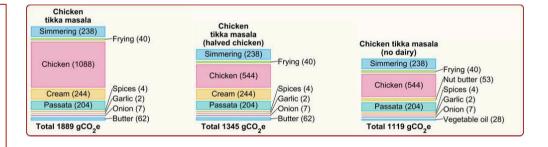

Some examples of high and low carbon meals - ahead of food labelling

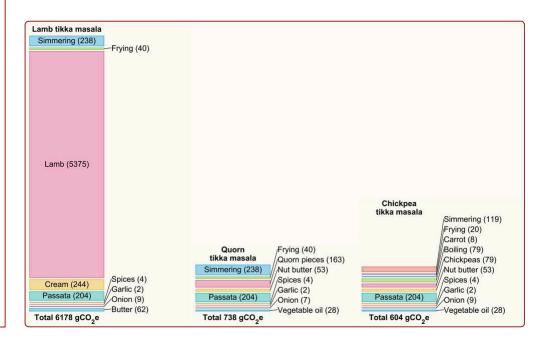

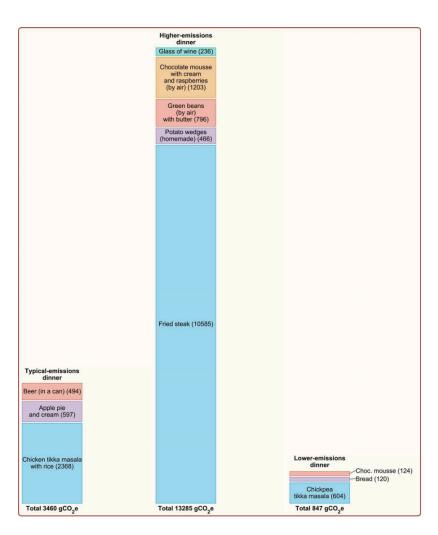

Some examples of high and low carbon meals - ahead of food labelling

Some examples of high and low carbon meals - ahead of food labelling

Summary of Proposed Actions & Estimated Impacts So Far

HDM Food waste initiative

Eradicating 73% of food waste would be a 23% reduction in food-related emissions and halving meat emissions by reducing beef & lamb for other options

Enabling EVs via charging point provision & removal of obstacles – 90% take-up by 90% who change vehicle reduces transportrelated emissions by 47%

De-carbonisation of electricity generation by market forces & govt reduces power emissions by 54%

Switching 80% of hhlds who have gas boilers to electric heat pumps reduces power emissions by 26% with half attributable to local enabling action

				Per cap	Per hhld	HDM now	HDM 2030 BAU	Reduction w/o HDM action	Reduction from currently- proposed HDM action	HDM 2030 so far

Residual emissions of 46,600 MtCO₂y⁻¹ require 8,740ha of woodland to offset

Woodland offset

Quantification of the carbon sequestration offered by woodland is sparse with a range of figures being proposed

This report uses verified numbers from The Forestry Commission Woodland Carbon Code Project which implies 5.3 tCO₂y⁻¹ per hectare but figures as high as 10 tCO₂y⁻¹ or as low as 2.5 can be found

Clearly much depends on the soil, aspect, type of tree and we will need to acquire expertise so we can make wise decisions

Woodland offset - Carbon Credits

Woodlands have long been a form of investment and the need for carbon offset and government encouragement of new planting has added to this

However a business case for both the Parish and for landowners is still to be developed and the Forestry Commission is likely to be an early port of call for advice

Assessing the investment returns from timber and carbon in woodland creation projects

chard Haw August 201

Financial returns from woodland creation have traditionally been generated from sales of timber. In recent years, the voluntary carbon market has established and grown in the UK and landowners can now generate additional revenue from the sale of carbon. The sale of carbon credits' allows landowners to increase their financial returns by creating woodlands for both timber and non-timber objectives. Even at conservative yield classes and low carbon prices, woodlands can generate £400c-£1300 of extra income per hectare when carbon credits are included, and much more for higher yield classes or carbon prices. The costs and benefits of woodland creation projects can vary significantly. However, this Research Note shows that, based on conservative assumptions for the five woodland ordy pes analysed here, the net present value for woodland creation increased by around 40-70% for some projects and enabled other projects to produce positive returns from the inclusion of carbon revenue. The analysis also shows that financial returns from commercial rotations can be increased by selecting a longer rotation length that will sequester more carbon. Even at low carbon prices, the extra carbon revenue generated from increasing the rotation length by five years outweighs the reduction in timber value from delayed harvesting. At higher carbon prices a further increase in rotation length could also be substantiated.

FCRN031

Box 2 Planting and establishment costs

Operations included in each of the five woodland types were drainage, fencing, insurance, plan preparation costs, beating up, plants and planting costs, general maintenance, ground preparation, establishment phase maintenance costs and weeding. The three broadleaved sites also contained costs for marking out, stakes, tubing and spiral guards. The two commercial (confire) sites also contained costs for roading. The table below summarises the undiscounted costs for the planting and establishment phase (15 years) and the total filetime of the whole woodland, as well as per heteriar for broad comparisons.

	Whol	e woodland	Per hectare		
Woodland type	Total lifetime costs	Planting and establishment costs	Total lifetime costs	Planting and establishment costs	
Farm woodland: managed for mixed objectives	£41 600	£23100	£13900	£7700	
Broadleaved woodland: managed for game and biodiversity	£49 300	£20000	£9900	£4000	
Broadleaved woodland: managed for timber	£66 900	£35600	£13400	£7100	
Upland conifer: managed for timber	£342 600	£170900	£6900	£3400	
Lowland conifer: managed for timber	£96 600	£51700	£9700	£5200	

grant rates (based on information from the Forestry Commission Grants and Licensing team). Maintenance payments of £200/ha for 10 years have also been included. In Scotland 80% of establishment and maintenance costs have been applied. In addition, landowners can usually retain farming subsidies, such as the basic payment, for a number of years following woodland creation. These have not been included.

Timber prices

Box 3 shows the size-price curves applied for typical softwood (confife) and hardwood (broadleaved) harvests. A further set of prices is also included for 'quality hardwoods' as the price of hardwood timber can vary significantly depending on the end-product quality as a result of the management regime.

Carbon prices

The analysis is based on carbon prices of £3, £6 and £9/CCQ, e paid up front to the landowners, via a project developer, for woodland creation. These prices broadly reflect a range of prices paid at present (2017). The Department for Business, Energy & Industrial Strategy publishes annually updated figures (previously produced by DECC) that reflect the cost of reducing emissions in order to meet UK climate change targets. A price of £60/CCQ-e has also been included to indicate this wider value of carbon sequestration to society. In reality, market prices are significantly short of this level but it does indicate the scale of benefit that investment in woodland creation provides to society.

Additional revenue sources

There are a number of other potential financial benefits for landowners creating woodlands. There may be additional benefits to farms from scaling back on activity no longer required and from shelter provided by woodlands. The presence of woodlands on farms has been shown to add to overall property values and many woodland owners also derive income from game shooting (John Clegg Consulting, 1993). Planting woodlands near rivers could also improve local water qualities and/or reduce water flows and risks of flooding, which can attract further grant funding and in some cases payments from water utility companies. None of these sources of income have been included in this analysis.

Carbon value of the woodland types

Table 2 shows the amount of claimable carbon sequestered by the different woodland types, based on the yield classes shown in Box 1, and its value at selected carbon prices. Even at low carbon prices it is possible to generate a significant amount of additional income from sales of voluntary carbon credits. The carbon sequestration that can be claimed for commercial woodlands is generally lower. Not all of the carbon sequestered can be claimed

Table 2 Carbon value of woodland

Woodland type	Area	Claimab seques		Carbon value of woodland/ha				
	ha	per ha	total	£3			£60	
Farm woodland	3	450	1 300	£1300	£2 700	£4000	£26 900	
Broadleaved woodland (G/B)	5	330	1 700	£1000	£2 000	£3000	£20 000	
Broadleaved woodland (T)	5	200	1 000	£600	£1 200	£1800	£12 300	
Upland conifer	50	130	6 300	£400	£800	£1100	£7 600	
Lowland conifer	10	240	2 400	£700	£1 400	£2200	£14 400	

Note: rounding has been applied to the tCO, and carbon value figures.

Woodland offset in the Parish

Approx 150 hectares (370 acres) of land in the parish is at our borders and is in Flood Zones 2 or 3.

It is likely therefore that a business case can be made to the landowners for these areas of land to be planted as woodland

Key

Flood plain outside the Parish of Haddenham

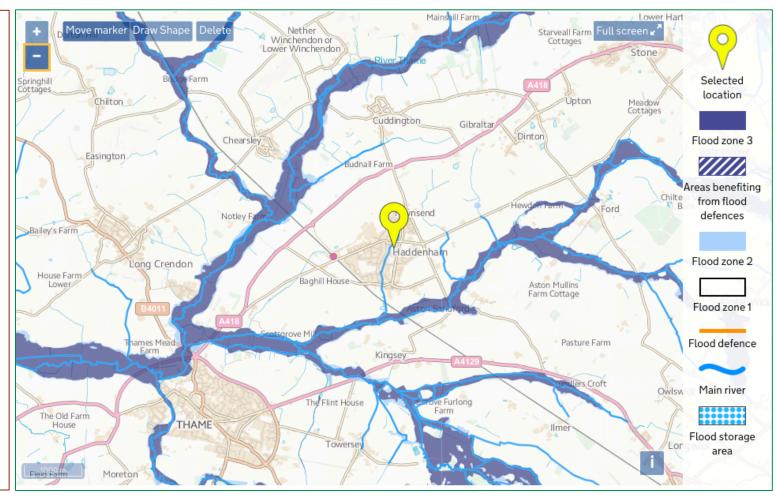

Flood plain within the Parish of Haddenham

Woodland offset adjacent to the Parish

If landowner reaction is positive and experts deem it feasible, it may be possible to also extend the programme to the flood plains across the parish borders in Aston Sandford, Kingsey, Thame, Long Crendon, Chearsley & Cuddington

Woodland offset - ReLeaf

ReLeaf is a local group already working with the Parish Council on planting trees as an offset for carbon emissions.

The group has expertise in this area and has already identified sources of advice, resources and funding for starting and scaling up the planting requirement within the parish boundary and beyond

More details about woodland offset can be found in its live proposal document in the URL on this page

Releaf - Proposal for a tree planting programme in Haddenham

Why plant trees?

Planting billions of trees across the world is by far the biggest and cheapest way to tackle the climate crisis, according to scientists. "This new quantitative evaluation shows [forest] restoration isn't just one of our climate change solutions, it is overwhelmingly the top one," according to Prof Tom Crowther at the Swiss university ETH Zürich, who led the research. "What blows my mind is the scale. I thought restoration would be in the top 10, but it is overwhelmingly more powerful than all of the other climate change solutions proposed."

Tree planting is "a climate change solution that doesn't require President Trump to immediately start believing in climate change, or scientists to come up with technological solutions to draw carbon dioxide out of the atmosphere", Crowther said. "It is available now, it is the cheapest one possible and every one of us can get involved." The study was published on 05/07/19 in the journal Science - you can read the abstract here

https://science.sciencemag.org/content/365/6448/76 You can read some further discussion of the study here

https://www.theguardian.com/environment/2019/jul/04/planting-billions-trees-best-tackle-climate-crisis-scientists-canopy-emissions

Wood is 50% carbon, so trees are a great carbon store. Their respiration also converts CO2 into oxygen. Trees are one of the few things that can actually take carbon out of the atmosphere and store it for the long term (carbon sequestration). Trees also build soil, stabilise local climates, mitigate flood water, help wildlife, provide food and wood. There are other benefits such as beauty and local amenity use, so wherever we can find space we should plant a native or fruit bearing tree. Better still, plant many. And then care for them.

Many organisations are starting tree planting campaigns, for example water companies have announced plans to plant 11 million new trees in England by 2030 to help the industry's effort to become carbon neutral.

https://www.independent.co.uk/environment/trees-planted-england-water-companies-a9061296

Ethiopia is in the middle of a campaign to plant 4 billion trees between May and October, they planted more than 350 million trees in a single day!

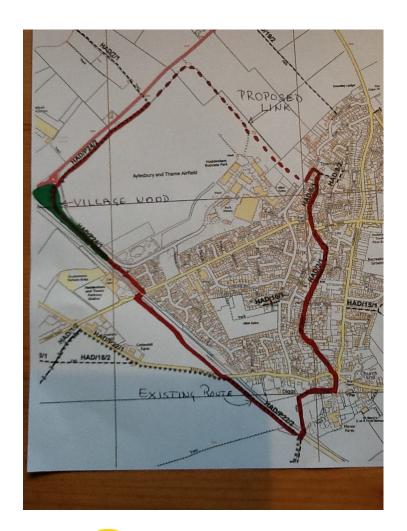

https://www.independent.co.uk/news/world/africa/ethiopia-trees-plant-world-record-abiy-ahmed-a9025896.html

Woodland offset - Village Wood Proposal

Brian Bowman has convinced Land Improvements to use approx. 2.7 ha of their land between the railway and Pegasus Way as a Village Wood.

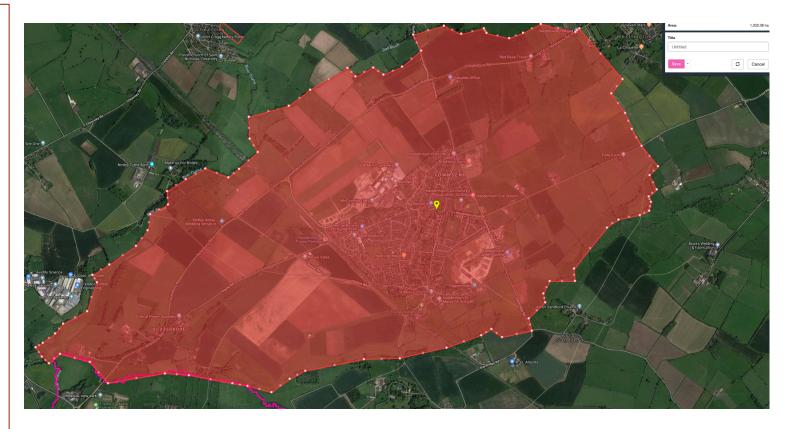

This adds a further 1.8% to the land identified and will offset 1.66 residents' emissions per annum at current levels

Land use in the Parish

The parish covers an area of approx. 1,330 hectares (3,285 acres)

Land use in the Parish

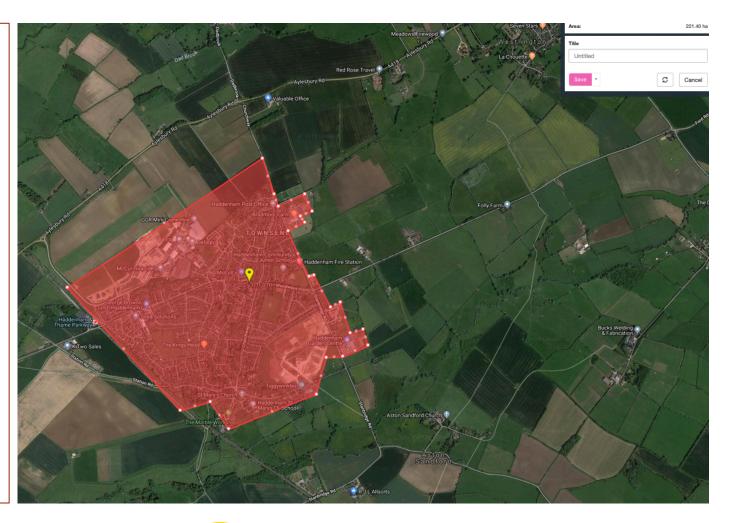

The built-up area, including the new developments, accounts for circa 220 hectares (544 acres)

This means there is approx. 960 hectares (2,370 acres) that is neither built-up nor in the flood plain

Grassland does have the potential to contribute as a carbon sink but agricultural land is usually a net emitter, especially if cattle or sheep are farmed

Work to assess the impact of this land, and its potential is still to be done

Action: To the extent woodland is needed in excess of what can be planted in the parish, the emissions will have to be offset elsewhere and a business plan for doing so will be needed

Addressing Main Obstacle #2

The inertia of existing habits

A pilot of enthusiasts for each initiative

We will use a pilot structure for generating behavioural change in the village

We will NOT seek to persuade, cajole or shame anyone into action as these approaches are respectively very difficult to pull off, annoying and counterproductive

Piloting involves finding people who have an immediate personal enthusiasm for participating in the specific initiative

Consequently their mindset is to help, report things that don't work in a constructive fashion with ideas for solving the problem, and they are likely to talk with enthusiasm about what they are doing to their friends and neighbours

It is more than likely that the participants on each pilot will be different people

Some people will not want to be involved at all. Ever. This is fine and no energy should be expended worrying about this nor on trying to specifically change their behaviour

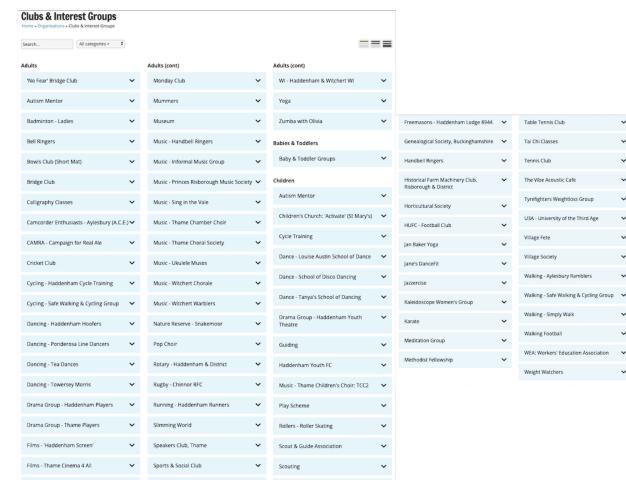

Recruit only enthusiasts for each pilot across as many existing social networks as possible

One of the many benefits of a "pilot" structure is that the activity becomes the communication about the activity.

Rather than broadcast "one-to-many", the communication is "many-to-many" as participants aré dispersed across the village's many existing social networks, and given they have joined the pilot because they are enthusiastic about it. not because they've had their arm twisted. the communication is positive and the mere fact of it nudges others into being more likely to join in

The main driver of most people's behavior is other people's behavior. Especially other people with whom they have things in common
